

Nucleotide excision repair

Nucleotide excision repairs DNA-injuries caused by UV radiation or carcinogenic substances like those found in cigarette smoke.

- 1 UV radiation can make two thymines bind to each other incorrectly.

- 2 The enzyme exinuclease finds the damage and cuts the DNA strand. Twelve nucleotides are removed.

- 3 DNA polymerase fills in the resulting gap.

- 4 DNA ligase seals the DNA strand. Now the injury has been dealt with.
